Concatenate

HackerRank

Concatenate

Two or more arrays can be concatenated together using the *concatenate* function with a tuple of the arrays to be joined:

```
import numpy
array_1 = numpy.array([1,2,3])
array_2 = numpy.array([4,5,6])
array_3 = numpy.array([7,8,9])
print numpy.concatenate((array_1, array_2, array_3))
#Output
[1 2 3 4 5 6 7 8 9]
```

If an array has more than one dimension, it is possible to specify the axis along which multiple arrays are concatenated. By default, it is along the first dimension.

```
import numpy
array_1 = numpy.array([[1,2,3],[0,0,0]])
array_2 = numpy.array([[0,0,0],[7,8,9]])
print numpy.concatenate((array_1, array_2), axis = 1)

#Output
[[1 2 3 0 0 0]
[0 0 0 7 8 9]]
```

Task

You are given two integer arrays of size $N \times P$ and $M \times P$ ($N \otimes M$ are rows, and P is the column). Your task is to *concatenate* the arrays along axis 0.

Input Format

The first line contains space separated integers $N,\,M$ and P.

The next N lines contains the space separated elements of the P columns.

After that, the next M lines contains the space separated elements of the P columns.

Output Format

Print the concatenated array of size $(N+M){\sf X}P.$

Sample Input

```
4 3 2
1 2
1 2
1 2
```

1/2

```
Sample Output
          [[1 2]
[1 2]
[1 2]
[1 2]
[3 4]
[3 4]
[3 4]
2/2
```

```
Change Theme Language Pypy 3 

# Enter your code here. Read input from STDIN. Print output to STDOUT
import numpy as np
x,y,z=input().split()
arr=[]

for i in range(int(x)+int(y)):
arr.append((list(map(int,input().split()))))
print(np.array(arr))
